Abstract

In September 2021, a significant jump in seismic activity on the island of La Palma (Canary Islands, Spain) signaled the start of a volcanic crisis that still continues at the time of writing. Earthquake data is continually collected and published by the Instituto Geográphico Nacional (IGN). …

Plain Language Summary

Earthquake data for the island of La Palma from the September 2021 eruption is found …

1 Introduction

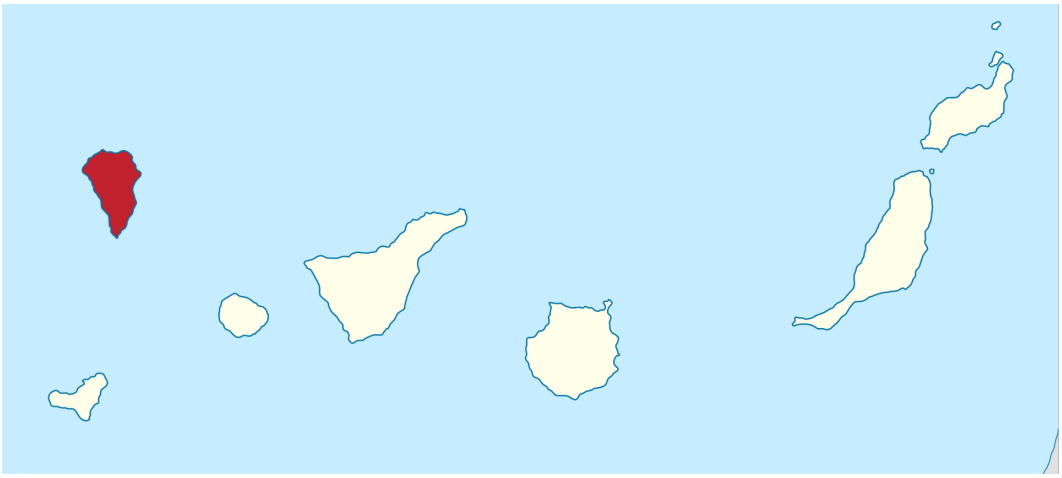

Figure 1: Map of La Palma

La Palma is one of the west most islands in the Volcanic Archipelago of the Canary Islands (Figure 1).

Table 1: Recent historic eruptions on La Palma

Name	Year
Current	2021
Teneguía	1971
Nambroque	1949
El Charco	1712
Volcán San Antonio	1677
Volcán San Martin	1646
Tajuya near El Paso	1585
Montaña Quemada	1492

Table 1 summarises the eruptions recorded since the colonization of the islands by Europeans in the late 1400s.

Let x denote the number of eruptions in a year. Then x can be modeled by a Poisson distribution:

$$p(x) = \frac{e^{-\lambda}\lambda^{x}}{x!} \tag{1}$$

Where λ is the rate of eruptions per year. Using Equation 1, the probability of an eruption in the next t years can be calculated.

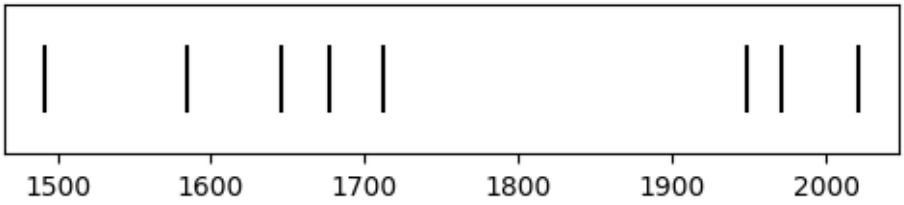

Figure 2: Timeline of recent earthquakes on La Palma

Based on the eruptions up to and including 1971, we would estimate λ to be $\frac{1}{79.8}$.

Studies of the magma systems feeding the volcano, such as Marrero et al. (2019) has proposed that there are two main magma reservoirs feeding the Cumbre Vieja volcano; one in the mantle (30-40km depth) which charges and in turn feeds a shallower crustal reservoir (10-20km depth).

Data and methods are discussed in Section 2.
